Part 2: About Web Interface(can quickly have a try, not recommend)

Basically we **highly recommend** using the **application software**, the web interface function is very simple, it doesn't support below features which the software support perfectly:

- **Basic function: enroll card/key fob to open door.**
- Download/view detail history entrance records and export to Excel(who open at what time)
- **Easily add/delete/activate/disable the user open privilege by professional management software.**
- Allow access for certain door at certain time for different users.
- **Can keep door auto open during business hour and then auto close at set time, support holiday security control.**
- Can swipe certain times to keep open and swipe certain times to close door.
- **Can be used for user attendance check also.**
- A lot other features such as anti-pass back, 1st card open, multi-card open .etc.
